MISSING OR MISMATCHED QUOTATION MARK IN STRINGS

Why it happens?:

Occurs when a string isn't properly enclosed in single or double quotes.

Correction:

Incorrect: `console.log("Hello);`

Correct: `console.log("Hello");`

Best Practice:

Always double-check that quotes are opened and closed correctly.

USING RESERVED KEYWORDS AS VARIABLE NAMES

Why it happens?: Happens when a reserved keyword is used as a variable.

Example: `let class = "Math";` "class" is a reserved word.
“class”, “function”, “break” are all reserved keywords.

Correction:

Incorrect: `let class = "Math";`

Correct: `let subject = "Math";`

Best Practice:

Avoid using reserved keywords in javascript.

TYPOS IN METHOD NAMES

Why it happens?: Typo causes javascript not to recognize the method.

Correction:

Incorrect: `console log("Hello");`

Correct: `console.log("Hello");`

Best Practice:

Use code editors with syntax checking and autocomplete.

INCORRECT USE OF PARENTHESES AND BRACKETS

Why it happens?: Arrays should use [], Objects use { }, Functions use ().

Correction:

Incorrect: `const arr = (2, 3);`

Correct: `const arr = [2, 3];`

Best Practice:

Understand and use correct bracket for each structure.

NOT CLOSING OBJECT OR ARRAY PROPERLY

Why it happens?: Objects and arrays need closing braces and commas between entries

Correction:

Incorrect: `const obj = { key1: "val1" key2: "val2" }`

Correct: `const obj = { key1: "val1", key2: "val2" };`

Best Practice:

Always match opening and closing brackets, and separate items with Commas
